

Mr Turab Syed,
CHG King's Park
Polmaise Road
Stirling
FK7 9PU

Patient: Mr Tom Summers (12-Jul-1984)
Address: 13 Castle Gardens, Drymen, Glasgow, G63 0HT
Hospital No: 22458566 **CRIS No:** 5592479
Referring clinician: Mr Turab Syed

Date of examination: 16-Feb-2026

REPORT

MRI Foot Rt: (reported 23-Feb-2026)

Clinical Details:

Assess swelling along plantar medial side of big toe. Assess metatarsal and sesamoid degeneration.

MRI Right Foot:

No previous imaging available for comparison at the time of reporting.

There are severe degenerative changes of the first metatarsophalangeal joint with complete loss of articular cartilage, bone on bone articulation, multifocal subarticular cystic change with bone marrow oedema and bulky osteophytes.

Severe degenerative changes between the head of the metatarsal and the sesamoids also noted.

Mild degenerative changes at the first tarsometatarsal joint and there is a 16 mm multiloculated ganglion between the bases of the first and second metatarsals, on the plantar aspect.

The remainder of the foot appears relatively well preserved.

No concerning soft tissue findings.

Conclusion:

- Severe degenerative changes of the first metatarsophalangeal joint with bulky osteophytes which may account for the apparent medial foot swelling. The appearances would be in keeping with hallux rigidus if this clinically correlates.
